

AI Agents for Image and Video Generation

Conclusion

Safety and responsible AI

Some mechanisms exist to make AI-generated content safer and more traceable

Safety filters

Content safety systems screen requests before generation happens. They block outputs that violate predefined policies, such as harmful, misleading, or restricted content.

Digital watermarking

An invisible marker is embedded into every AI-generated image and video, making it always possible to identify content as AI-generated.

Safety and responsible AI

Beyond built-in protections, you can add your own safety logic to define exactly what your application generates and how

System instructions

A prompt prefix passed to the model that defines application-level rules before generation happens. Use them to restrict topics, enforce a specific output style, or set content boundaries tailored to your use case.

LLM-as-a-filter

For nuanced concerns that require context-aware judgment, cultural sensitivity, brand compliance, domain-specific rules, you can use an LLM as a programmable evaluation checkpoint directly in your generation pipeline.
